

(a) Land intercept exceeds the signal

Roy et al. (2016) coefficients, fitted over vegetation and soil, vs native Landsat reflectance over the lake water. The dashed line marks intercept = signal

(b) Sensors remain distinguishable

Accuracy of a Random Forest predicting the source sensor from already harmonized reflectance. If harmonization worked, it would be at chance

(c) Blue is the band that agrees least between sensors

Sentinel-2 reflectance vs Roy-harmonized Landsat in the 270 events observed by both sensors at the same station and date. The dashed line is 1:1

(d) Local recalibration over water does harmonize bands

Median reflectance over water by sensor. Labels are the Landsat / Sentinel-2 ratio: it goes from 15.4x in NIR to ~1.0x in every band
