

(a) Only campaign blocking neutralizes its own null model

R^2 of models predicting only the group mean, with folds blocked by campaign.

A blocking unit is effective if and only if its own null model collapses to zero under it

(b) Station blocking changes nothing; extrapolation breaks everything

Out-of-fold R^2 of the Random Forest; the large point is the primary design.

The fact that station blocking matches with random does not prove absence of leakage: it proves that it retains nothing
