

(a) Calibrated, on average

Out-of-fold empirical coverage vs nominal. Gray band is ± 3 points

(c) But not at the ends of the range

Split-conformal uses a single global quantile, so the width is constant (~ 6.1 m) and the interval cannot adapt: it undercovers in the clearest water

(b) The 90% interval vs the measurement

Match-ups ordered by measured transparency. The line is the prediction, the band is the 90% conformal interval. 86 out of 812 points fall outside
