

(a) Land intercept exceeds the signal

Roy et al. (2016) coefficients, fitted over vegetation and water, vs native Landsat reflectance over the lake water from the already harmonized reflectance. If harmonization worked, it would be at chance

(b) Sensors remain distinguishable

Accuracy of a Random Forest predicting the source sensor from the already harmonized reflectance. If harmonization worked, it would be at chance

(c) Blue is the band that agrees least between sensors

Sentinel-2 reflectance vs Roy-harmonized Landsat in the 270 events observed by both sensors at the same station and date. The dashed line is 1:1

(d) Local recalibration over water does harmonize bands

Median reflectance over water by sensor. Labels are the Landsat / Sentinel-2 ratio: goes from 15.4x in NIR to ~1.0x in all bands
