

(a) Predicho frente a medido

Random Forest, campaign-blocked

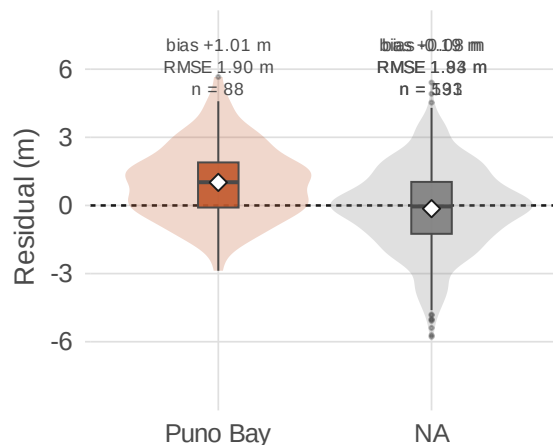

validation. Dashed line is 1:1

(b) Overestimates where it matters most

Residuals (predicted - measured) by zone.

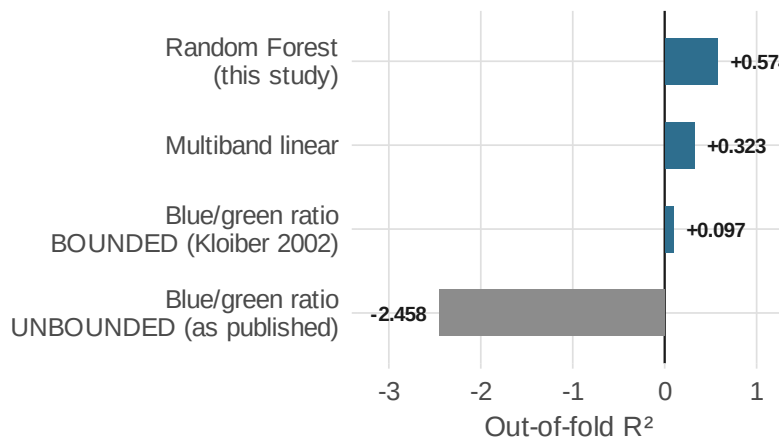

Diamond is the media. Puno Bay, la zona más eutrófica, +1.0 m

(c) El baseline estaba mal implementado

Same validation design for all.

The published baseline undid the log without bounds; a single 143 m prediction ruined its R^2

(d) One impossible prediction is enough

Classical ratio on log scale.

The 143 m point is the one that produced the $R^2 = -2.46$
